

# **ENZYME ACTIVITY DETERMINATION OF ENZYMES AS:**

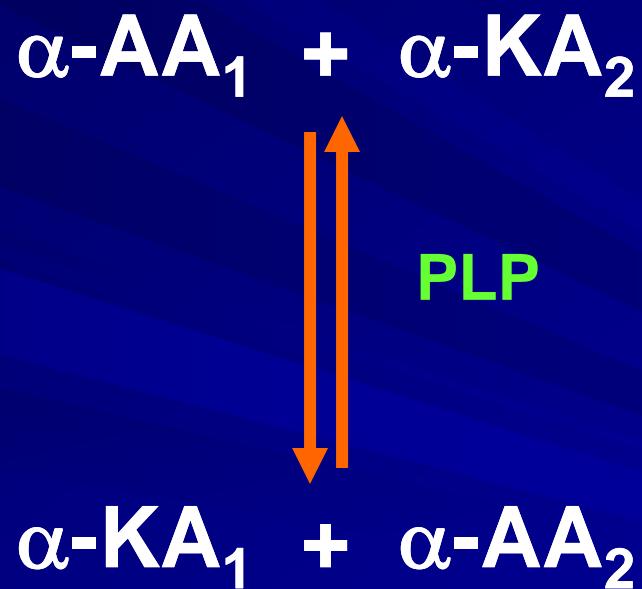

**■ REAGENTS**

**■ ANALITES**

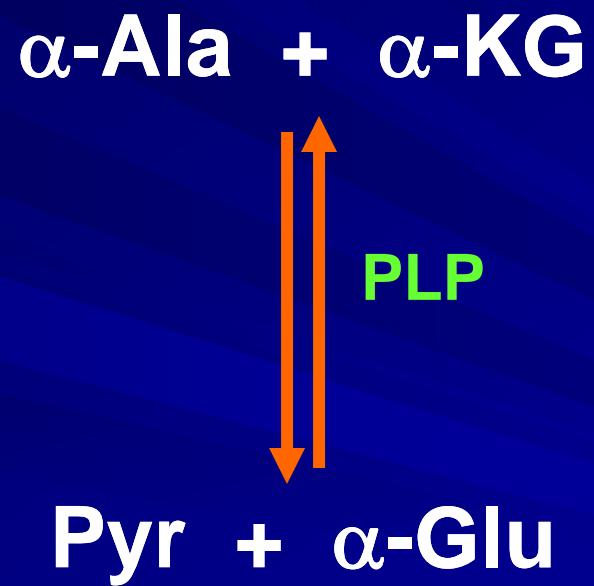

# PROGRESS CURVE

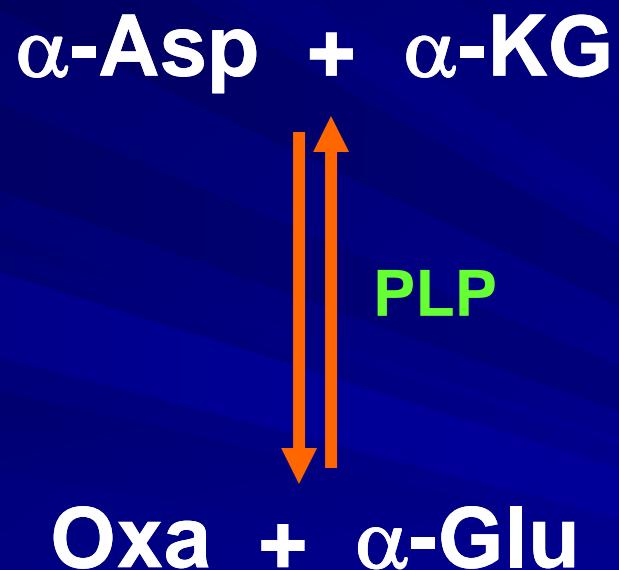

# AMINOTRANSFERASE ACTIVITY DETERMINATION

# **ALANINE TRANSAMINASE (ALT, GPT)**

# ASPARTATE TRANSAMINASE (AST, GOT)

# METHODS

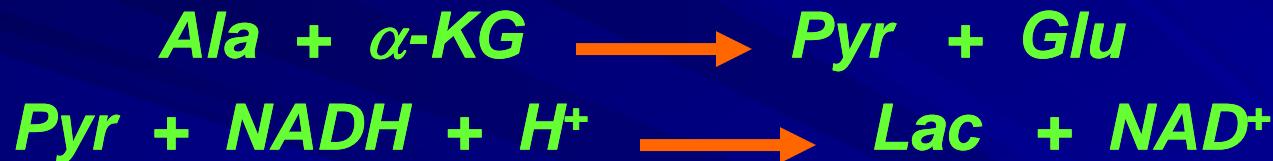

## ■ COLORIMETRIC (*Reitman-Frankel*)

Reaction with *2,4-Dinitrophenyl hydrazine*

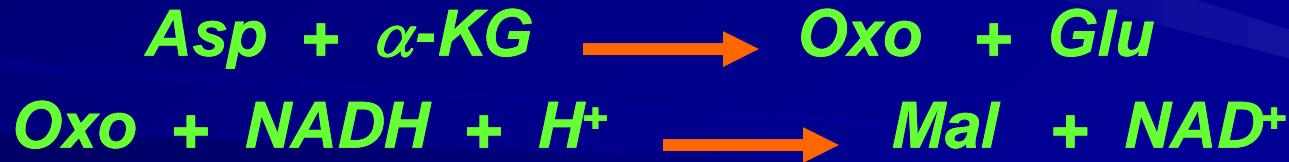

# METHODS

## UV SPECTROPHOTOMETRIC (*Karmen*)

### 1) ALT

### 2) AST

# AMINOTRANSFERASES

## SPECIMEN:

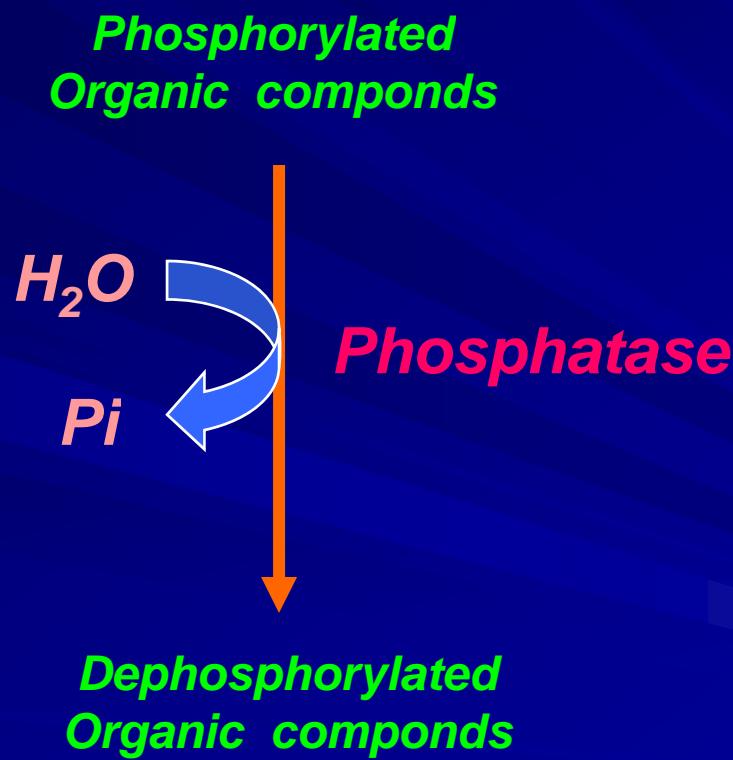

- *Serum or plasma can be used , but heparinized plasma is not suitable for ALT when TRIS buffer is used*
- *Hemolysis increases AST*
- *Serum is stable for one week at 4°C and more in -20°C*

# **PHOSPHATASES**

**Alkaline Phosphatases (ALP)**

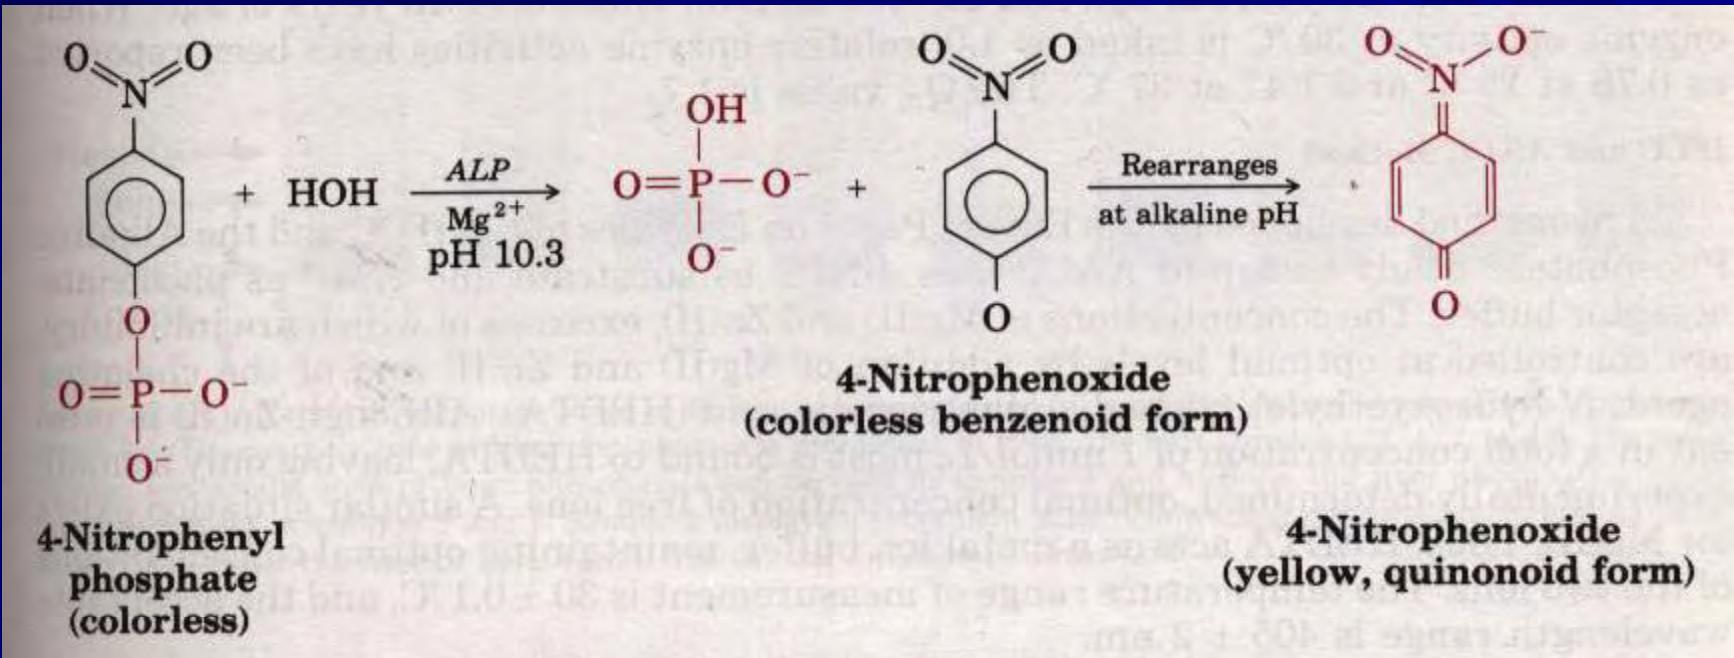

**Acid Phosphatases (ACP)**

# BASIS OF PHOSPHATASE ACTIVITY DETERMINATION

# SUBSTRATES

- **$\beta$ -Glycerophosphate** (*Kay, Bodansky*)
- **Phenylphosphate** (*King & Armstrong*)
- **4-Nitrophenylphosphate (4-NPP)**  
*(Pranitrophenylphosphate, PNPP)*  
(*Bessy, Lowry, Brock*)

# **AMINOALCOHOL BUFFERS**

- 2-Amino-2-methyl-1-propanol (AMP)
- Diethanolamine (DEA)
- Ethylaminoethanol (EAE)

# ALKALINE PHOSPHATASE

## METHOD:

- *Using PNPP*
- *At pH = 10.3*
- *End Point Or Kinetics*

# ALKALINE PHOSPHATASE

## SPECIMEN:

- *Diet*
- *Position & Stasis*
- *Serum or Heparinized Plasma*
- *Hemolysis*
- *Increasing by Storage*

# LACTATE DEHYDROGENASE ACTIVITY DETERMINATION

Pyruvate + NADH + H<sup>+</sup>

Lactate + NAD<sup>+</sup>

# METHODS

## ■ COLORIMETRIC

Reaction with *2,4-Dinitrophenyl hydrazine*

## ■ UV SPECTROPHOTOMETRIC

# SAMPLE

- Serum or Heparinized Plasma
- Activity, Stasis
- Unstability
- Hemolysis

# **BILE PIGMENTS DETERMINATION**

# BILIRUBIN DETERMINATION

- DIRECT SPECTROPHOTOMETRIC
- *Bilirubin Is the Main (40-95%) Serum Pigment; Other Pigments Include Carotene, Xanthophil Ester, Bilifuscin & Mesobilifuscin*
- Absorbance at 454 nm
- Interferences due to Lipochromes → Hemolysis, Turbidity
- Only for Newborns
- $A_{454} - A_{540}$

# BILIRUBIN DETERMINATION

## ■ OXIDATION METHODS

- *Gemelin*
- *Marchal & Maher*
- *Smith*
- *Fouchet*
- *Harrison Spot Test*

# BILIRUBIN DETERMINATION

## ■ DIAZOTIZATION METHODS

- Bilirubin + Diazotized Sulfanilic Acid  Azobilirubin
- In 1883, Ehrlich first describe this reaction by using urine sample
- In 1913, van der Berg Showed that Diazo reaction can be used for serum only after adding a solubilizer or accelerator
- In 1937, Malloy and Evelyn developed the first clinically useful methodology for quantitation of bilirubin in serum samples using classic diazo reaction with a 50% methanol as an accelerator
- In 1938, Jendrasic and Grof described a method using the diazo reaction with caffeine-enzoate-acetate as an accelerator
- In the early 1980s, it was recognized that total bilirubin is not equal to conjugated bilirubin plus unconjugated bilirubin

# BILIRUBIN DETERMINATION

## ■ Malloy & Evelyn Method

- Reaction takes place at pH 1.2 in which azobilirubin has a red-purple color with a maximal absorption at 560 nm
- Uses methanol as accelerator, which can cause turbidity with proteins

# BILIRUBIN DETERMINATION

## ■ Jendrassik & Grof Method

- By adding alkaline tartarate, absorbance spectrum of azobilirubin to a more intense blue color that is less subject to interfering substances in the sample and is measured at 600 nm
- This method is slightly more complex , but has the following advantages over the Malloy-Evelyn method :
  - Not affected by pH changes
  - Insensitive to a 50-fold variation in protein concentration
  - Maintains optical sensitivity even at low bilirubin concentrations
  - Has minimal turbidity and a relatively constant blank
  - Is not affected by hemoglobin up to 750 mg/dL

# TYPES OF BILIRUBIN

- Bond To Glucoronide (Conjugated)
- *Monogluconide* →  $\beta$
- *Diglucoronide* →  $\gamma$
- Bond to Albumin
- Noncovalently (Unconjugated) →  $\alpha$
- Covalently Bilirubin →  $\delta$

# BILIRUBIN DETERMINATION

## ■ SAMPLE

- Serum or plasma can be used
- Serious loss of bilirubin occurs after exposure to fluorescent and indirect and direct sunlight
- If left unprotected from light, bilirubin values may reduce by 30-50% per hour
- If serum or plasma is separated from the cells and stored in dark, it is stable for 2 days at room temperature, 1 week at 4°C, and indefinitely at -20°C

# **DETECTION OF BILIRUBIN IN URINE**

- **Shake Test**

- **Oxidation Methods**

- 1) Gemelin (Nitric acid)
- 2) Marshal (Sodium nitrite in acid)
- 3) Smith (Iodide alcohol)
- 4) Fouchet (Ferric chloride in acid)
- 5) Harison pot test (Ferric chloride and Barium sulfate)

- **Diazotization Methods**

- 1) Reagent strip (2,4-Dichloroanilin)
- 2) Hanter Diazotization (sodium nitrite and sulfanilic acid)
- 3) Ictotest (para-nitrobenzene diazonium)

# BILIRUBIN DETECTION

## ■ False Positive Results

- 1) *Drugs such as Phenazothiazine,  
Chlorpromazine,*
- 2) *Indole and indican*

## ■ False Negative Results

- 1) *Exposure to light*
- 2) *Hydrosis of bilirubin diglucoronide*
- 3) *Ascorbate*
- 4) *Nitrite*
